A single 10 port valve permits alternate injections from two loops, which may be identical or of different sizes. This technique ... While there are a variety of flowpaths available in the In Position A, sample fills the two loops in series. In Position B, the sample is simultaneously injected

into two separate flow paths. One valve performs the functions of sampling and backflush valves, simplifying operation and reducing cost. When components of interest are low boiling, this plumbing scheme allows "heavy" components with long retention times to be separated. With the valve in Position A, sample flows through the external loop while the carrier flows directly through to the chromatographic column.
